

Biobased Hydraulic Fluids Prove Successful in Military Field Demonstration

The U.S. Army Tank-Automotive Research, Development and Engineering Center (TARDEC) has successfully completed a field demonstration of biobased hydraulic fluids for military construction equipment. The year-long field demonstration, conducted at Fort Leonard Wood, Mo., found that all five of the biobased hydraulic fluids they tested performed well in all of the equipment.

The field test successfully verified the performance of biobased hydraulic fluids for use in construction equipment.

“Biobased hydraulic fluid is an environmentally acceptable product and its lubrication performance is very similar to the conventional petroleum-based fluid,” said Dr. In-Sik Rhee, Senior Researcher, U.S. Army TARDEC. **“This type of fluid can be used in the conventional and future hydraulic systems.”**

During the testing, TARDEC experienced no problems with compatibility, leaking, low temperature and more. The biobased fluids were compatible with existing petroleum-based fluids, indicating that the change to biobased fluids does not require a major hydraulic system cleaning. There were no seal material failures, leaks in any of the components or degradations in the

system during the demonstration. Metal tests showed compatibility between the biobased fluids and the metals used in the structure of the hydraulic systems. Other tests showed that the biobased fluids did not generate or absorb water, did not have a volatility problem, and the viscosity of the fluids did not change significantly during the one-year test period. Further, the use of the biobased hydraulic fluids had no impact on the military mission of the unit.

Beginning in July 2006, ten pieces of construction equipment (crane, bulldozer, scraper, grader, loader, excavator, etc.) were switched from petroleum-based to biobased hydraulic fluid in order to verify the performance of biobased hydraulic fluids.

The demonstration project was part of the U.S. Army's efforts to increase the use of biobased hydraulic fluids as a way to reduce petroleum consumption and the generation of hazardous waste. The Army also wanted to assess which biobased products would be effective in reducing contamination of ground and surface waters as well as soils impacted by spills and leaks. The project was supported by the U.S. Department of Agriculture (USDA) under its Federal Biobased Products Preferred Procurement Program, which was established by Section 9002 of the 2002 Farm Bill. The biobased procurement requirements in Section 9002 direct federal agencies to give a purchasing preference to biobased products listed by USDA. USDA has listed hydraulic fluids for mobile equipment (with a minimum biobased content of 44%) as a designated biobased item. ▶

A crane at Fort Leonard Wood, Mo. was one of ten pieces of construction equipment that was switched from petroleum-based to biobased hydraulic fluid.

March 16, 2007 was the effective date for agencies to begin providing a purchasing preference for this item. However, there is an exception from the purchasing preference if a product fails to meet the agencies' established performance standards. The Army's demonstration project, therefore, was critically important in verifying the field performance of biobased hydraulic fluids.

"Agriculture provides not only the raw materials for food, feed and fiber, it can also support the U.S. industrial base with products that meet performance requirements," said Carmela A. Bailey, National Program Leader, Agricultural Materials, U.S. Department of Agriculture Cooperative State Research, Education and Extension Service, who worked with TARDEC on the project.

FACT FILE

America's farms are just beginning to tap their potential as a source for natural, renewable biobased products that offer benefits to worker health, the environment, America's economy and energy security. To learn more about the many biobased products made from soybeans, go to www.soybiobased.org. Because of the potential for biobased products to create new markets for soybeans, U.S. soybean farmers have invested millions of dollars to research, test and promote biobased products. Much of this work was done through the United Soybean Board (USB), which is composed of 68 U.S. soybean farmers appointed by the U.S. Secretary of Agriculture to invest soybean checkoff funds. As stipulated in the Soybean Promotion, Research and Consumer Information Act, USDA's Agricultural Marketing Service has oversight responsibilities for the soybean checkoff.
